

Architecture Diagram - Fabula Dental System

Architecture Description

The system adopts a three-tier client-server architecture, where users (administrator, receptionist, and dentist) access the application via a web browser. The presentation layer consumes REST services exposed by the backend. The business logic centralizes system rules, authentication via JWT, and role-based access control. The persistence layer manages CRUD operations on a PostgreSQL database using Prisma as the ORM. All components are deployed in a cloud environment and communicate via secure HTTPS connections, ensuring a modular, decoupled design that facilitates maintenance and future expansion.
